## INTEGRATED STEREO AMPLIFIER

### SPECIFICATIONS

#### Amplifier section

##### Continuous RMS power output

(Less than 0.004% THD, both channels driven simultaneously) 20 Hz - 20 kHz  
80 + 80 watts (8 ohms)  
According to DIN 45500  
80 + 80 watts (8 ohms)

##### Power bandwidth (IHF)

5 Hz - 100 kHz

##### Dynamic headroom

1.9 dB\*

##### Slew rate

→ 200 V/μ sec

480 V/μ sec (power stage)

##### Harmonic distortion

Less than 0.004% at rated output  
Less than 0.003% at 40 W output

##### Intermodulation (IM) distortion

(60 Hz : 7 kHz = 4 : 1)

Less than 0.004% at rated output  
Less than 0.003% at 40 W output

##### Frequency response

PHONO RIAA equalization curve ±0.2 dB

TUNER

AUX

TAPE 1, 2

0.1 Hz - 600 kHz ±<sub>3</sub><sup>0</sup> dB

##### Residual noise

Less than 25 μV (8 ohms, network A)

##### Damping factor

150 (8 ohms, 1 kHz)

#### WARNING!!

THIS SET USES THE SWITCHING-TYPE POWER-SUPPLY CIRCUIT, WHICH IS DIRECTLY CONNECTED TO THE AC POWER LINE. AN ISOLATION TRANSFORMER SHOULD BE USED DURING ANY SERVICE TO AVOID POSSIBLE SHOCK HAZARD.

#### Inputs

	Setting of the CARTRIDGE LOAD selector	Sensitivity	Impedance	Maximum input capability (1 kHz)	S/N (weighting network, input level)

UK model: AC 240V ~ 50/60Hz 370W

## SERVICING NOTES

1. This set employs a pulse power supply as opposed to a conventional circuit with a power transformer.
  - 1) The pulse power supply rectifies and filters the commercial power source directly, so a higher than usual DC voltage is applied to the power supply section. Take sufficient care when servicing.
  - 2) The pulse waves contain a large amount of high cycle components, and in order to prevent interference from this waste radiation, the pulse power supply board is enclosed in a separate aluminum case.
  - 3) If either Q903 or Q904 is defective, replace both. The replacement part includes both transistors.  
 Service Code  
 X-4873-603-1 transistor kit  
 (2SC2944)
2. After AC rectification, there is still voltage remaining in the aluminum electrolytic capacitor (C952) even when the power switch is OFF, so be very careful when discharging. Be sure to use a resistor with 100Ω value. It is dangerous to discharge by using a lead directly.

### Servicing Notes/Checking the Pulse Power Supply Section

1. When checking or servicing the pulse power supply, spread an insulation sheet on top of the chassis or the case.
2. Be careful not to cause a short in the chassis or the case.

### Replacement of Pulse Power Supply Transformers (T901, 902)

The leads of transformers T901, 902 in the inverter circuit are shown in the illustration below. Only the core is supplied for T901, 902 replacements parts, without the lead cover.

In the event of a defect, refer to the illustration to prepare the transformer. Make sure that the leads are of uniform length.

Handwriting practice area with horizontal dashed lines.

## SECTION 1 OUTLINE

### 1-1. CIRCUIT DESCRIPTION

#### V-I Amp, Current-type Tone Control, Servo System

The general composition of TA-AX7 is shown in Figure 1. New circuits are the V-I converter (V-I amp), current-type tone control and the servo system.

#### • Servo System

There is a servo loop in the equalizer amp and the V-I converter. Following is a basic explanation using the equalizer amp as an example. The servo in the V-I converter is discussed in the section on the converter. The equalizer amp basically consists of a DC amp, but when there is no servo loop, a considerable amount of offset voltage will appear in the output signal. Even if the  $\pm$  offset voltage is suppressed by balance adjustment, it usually drifts over a long period of time. Generally, a capacitor is inserted into the output circuit to intercept the DC components. In this case the following two problems arise:

- 1) When DC potential is applied to the input circuit, the output signal actuation point deviates and the upper or lower part of the waveform will be clipped.

- 2) There is a danger of deterioration in sound quality because of the capacitor.

The servo loop serves to prevent these problems. Basically, it detects the DC voltage deviation in the output signal and feeds it out-of-phase to the input signal, thus removing the deviation.

Figure 3 is a theoretical diagram. Here  $\beta_1$  is a conventional feedback loop, and without  $\beta_2$ , the system's gain is around  $1/\beta_1$  ( $\beta_1$  in Figure 5).  $\beta_2$  servo loop amplifies only the DC components and returns them to the input circuit, so it consists of the integrator.

Fig. 3

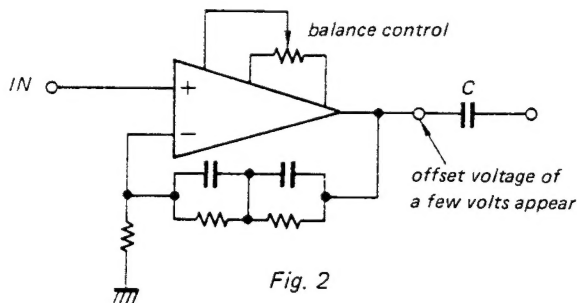

Fig. 2

Fig. 4

Fig. 1

In the Bode's diagram in Figure 5, if  $A$  is the amp open-loop gain, and  $\beta_1$  is a regular feedback loop (here, equalizer element), and without  $\beta_2$ , the system's frequency response becomes  $\beta_1$  (same as conventional system). When  $\beta_2$  loop is added, and the frequency is below the intersecting point of the frequency responses of  $\beta_1$  and  $\beta_2$ , the gain is less than  $B_1$ , and ultimately becomes  $B_{12}$ . The difference between  $B_1$  and  $B_{12}$  is due to the increase in NFB amount, so the offset drift is improved as shown by the slanting lines in the diagram. (At frequency  $f_L$  (Hz), suppressed to  $1/GL$ .) Also, as seen at  $B_{12}$ , the gain becomes even less as the frequency is lowered, so even if dc component is applied to the input signal, it will not appear in the output.

Fig. 5.

In Figure 3,  $\beta_2$  was described as simply feeding back to the input signal, but in TA-AX7's equalizer it passes through an auxiliary circuit and feeds in partway along the circuit. Figure 6 shows the location where it feeds in.

In the input section of the CX550 equalizer, an FET one-stage buffer is added. And, the integrated output signal of the servo detection is applied to the differential amp of the two transistors. It is fed into the circuit by adding the current from this collector to the FET drain. The feed-in to the V-I amp will be explained later.

Fig. 6.

## V-I Converter (IC201)

In TA-AX7, the input voltage signal is converted once to a current signal, and the signal is transmitted by changing it back to voltage form through a resistor. Gain control is accomplished through this variable resistor. In Figure 7, if V-I amp input is  $e_i$  (V) and output current is  $i_o$  (A),

$$i_o = g \cdot e_i \dots \dots \dots (1)$$

" $g$ " is converter conductance, and the unit is S (Si seimence). In this set " $g$ " is 0.67 (mS).

Fig. 7.

This current  $i_o$  is changed back to output voltage  $e_o$  (power amp input voltage) by resistance  $R_v$ . In other words:

$$e_o = i_o \cdot R_v \dots \dots \dots (2)$$

This formula for voltage gain is for a circuit including both V-I amp and  $R_v$ .  $R_v$  does the gain control, and  $g=0.67$  (mS), so when  $R_v=1.5$  (k $\Omega$ ), it becomes unity gain (0dB).

Figure 8 is a basic diagram of the V-I converter circuit.

Fig. 8.

(Note: In TA-AX7 circuit,  $R_1-R_4$  correspond to the following resistors:  $R_1-R205$ ,  $R_2-R208$ ,  $R_3-R209$ ,  $R_4-R206$ .)

Assume the following:

1. The operation amp is operating normally, so  
 $i_{op} = 0, e_s = 0, i_{om} = 0$
2.  $\frac{R_1}{R_4} = \frac{R_2}{R_3}$  (condition for constant current)

Also,  $R_1 = R_4$ , and  $R_2 = R_3$ .

Figure 9 shows Figure 8 rewritten. First,

$i_{om} = 0$  therefore  $i_1 = i_2$

$i_{op} = 0$  therefore  $i_4 + i_L = i_3$  ..... ③

Also,  $R_2 = R_3$  and  $e_s = 0$ , so

$i_2 = i_3$  ..... ④

Therefore, from ③ and ④:

$i_1 = i_4 + i_L$  ..... ⑤

This means that the sum of the current flowing on  $R_1$  is equal to that flowing on  $R_4$  plus  $R_L$ . By focusing on  $R_1$ , this current value is as follows:

$i_1 = (e_o - e_i)/R_1 = -e_i/R_1 + e_o/R_1$  ..... ⑥

For the same value ( $i_4 + i_L$ ),  $i_4$  is:

$i_4 = e_o/R_4 = e_o/R_1$  (because  $R_4 = R_1$ )

So, from formula ⑥, the remaining  $i_L$  is  $-e_i/R_1$ , or:

$i_L = -\frac{1}{R_1} \times e_i$  ..... ⑦

$R_L$  does not appear in this formula, so "output current has no relation to load resistance" or the current is constant.

It can be seen from formulas ① and ⑦ that the aforementioned "g" is  $g = -1/R_1$ . The negative sign indicates the reverse amplifier. When there is signal-source resistance on the input circuit, this V-I converter destroys the constant current, so a buffer stage is inserted before it. Also, the servo is the same up to detecting  $e_A$  level and integrating, but after that this is V-I converted and fed into the connecting point of  $R_1$  and  $R_2$ . Then it controls  $i_1$  flowing into  $R_1$ , so it is the same feed-in value as that of the  $e_i$  which originally produced one part of  $i_1$ .

Fig. 9.

### • Current-type Tone Control

This is a current input-output type tone amp inserted between the V-I amp output signal and gain controller (RV607). The basic diagram of the current-current amp is shown in Figure 10. Note that there is no potential difference between the input and output terminals. Based on this the diagram is rewritten as shown in Figure 11.

If the current does not flow into the operation amp, and  $e_s = 0V$ ,  $i_1 \cdot Z_1 = i_o \cdot Z_2$

$$\therefore i_o \therefore \frac{i_1}{i_o} = \frac{Z_2}{Z_1}$$

From the above formula it can be seen that the value of the ratio of  $i_1$  to  $i_o$  is determined by the ratio of  $Z_2$  to  $Z_1$ . Actually, as shown in Figure 12, conventional impedance is employed. The part below the dotted line sets the impedance ratio for high frequency, and the part above for low frequency. The section with the switch is Bass Boost, and Switch OFF  $\rightarrow Z_1$  impedance rising in low frequency  $\rightarrow Z_1 > Z_2 \rightarrow i_p > i_1 = \text{low boost}$ .

Fig. 10.

Fig. 11.

Fig. 12.

## Checking of Individual Boards

Fig. A

If breakdown is suspected in any of the individual boards (equalizer amp, V-I amp, power drive), use the following methods for voltage and operation checks.

### — Equalizer Amp Board —

Connect as shown in Figure C. If it is just an operation check, the equalizer element only requires resistance. Use as thick a ground as possible, and the bypass capacitor should be around 470-1,000  $\mu\text{F}$  (25V). The center gain will be about 36dB at 1kHz. Therefore, when input level is -36dB, the output voltage will be 0dB.

### — V-I Amp Board —

Connect as shown in Figure D. Bypass with a capacitor with a good high frequency response on +6 and 8- pins. (Without the capacitor, there is a danger of oscillation in the buffer stage.) The V-I amp board is composed of the buffer stage and V-I amp. The buffer outputs at pin 7, so the defective point should be determined before or after this point. (See Figure A) There is a small amount (less than 1V) of dc offset voltage in the buffer stage. Output at pin 2 is current output, so pass it through resistor  $R_v$  when doing a voltage check. When  $R_v = 1.5\text{k}\Omega$ , IN/OUT becomes unity gain, so if input voltage is -16dB, output voltage is around 0dB. The set will receive maximum volume control of  $10\text{k}\Omega$  so check up to  $10\text{k}\Omega$ .

### — Power Drive Board —

Connect as shown in Figure E. Because center gain is 28dB, if input voltage is -28dB the output voltage will become 0dB. If the lead wires are not arranged properly on the board, oscillation may occur. In this event put a capacitor of around 47pF between IN and the ground (pin 1, 2) and 12pF between pin 4 and the ground to stop the oscillation.

1S1555X6, MV12NX3, SV04+MC12V, etc. can be used for the 6 diodes between pins 9-15.

In actual connection there is no balance adjustment so dc offset voltage is generated, but by reconnecting in either of the ways shown in Figure B, the plus and minus of the output offset voltage should reverse.

## SECTION 2 DISASSEMBLY

### 2-1. REMOVAL

Note: Follow the disassembly procedure in the numerical order given.

#### Top Cover

#### Bottom Plate

- 1-3 front panel
- 4-6 ornamental side plate

#### Pulse Power Supply Block

Note: Do not remove the four screws marked with \*.

#### Pulse Power Supply Board

#### Front Panel/Ornamental Side Plate

- 1 Loosen five screws, BVTT3x6.

#### Front Subchassis

#### Main Board

## SECTION 3 ADJUSTMENTS

### 3-1. ELECTRICAL ADJUSTMENTS

#### Note:

1. DC BIAS and DC BALANCE adjustments should be made several minutes after the POWER switch is turned on (POWER ON.).
2. Make DC BIAS adjustment first.
3. Repeat DC BIAS and DC BALANCE adjustments two or three times.
4. After replacing the power transistors, DC BIAS and DC BALANCE adjustments should be made.
5. Perform the adjustments in the numerical order given.

#### 1. DC BIAS Adjustment (with no signal input)

Adjust RV653 for 5mV reading on the VOM.

Adjust RV603 for 5mV reading on the VOM.

VOM (DC range)

VOM (DC range)

#### 4. Equalizer Amp Balance Adjustment (With no signal input)

FUNCTION Switch: PHONO  
REC OUT SELECTOR Switch: PHONO  
CARTRIDGE LOAD Selector: MC

1. Connect a VOM across the REC OUT terminal.
2. Adjust RV101 (L-CH) and RV151 (R-CH) for 0mV reading on the VOM.

RV101  
(L-CH)

RV151  
(R-CH)

#### 2. DC Balance Adjustment (With no signal input)

1. Connect a VOM across the SPEAKER terminal.
2. Adjust RV602 (L-CH) and RV652 (R-CH) for 0V reading on the VOM.

Note: Set the VOM high at first. After obtaining 0V reading, lower the range gradually and adjust RV602 and RV652.

RV652  
(R-CH)

#### 3. V-I Amp Balance Adjustment

1. Connect a VOM across the SPEAKER terminal.
2. Slide the GAIN control fully rightwards (maximum gain position).
3. Adjust RV201 (L-CH) and RV251 (R-CH) for 0mV reading on the VOM.

Note: As the dc-servo circuit operates in the V-I amp circuit, make this adjustment slowly (meter-stop time: 1-2 seconds)

### NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "▲" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (Δ-ΔΔΔ-ΔΔΔ-XX or Δ-ΔΔΔΔ-ΔΔΔ-X) may be different from those used in the set.

### CAPACITORS:

- All capacitors are in μF. Common capacitors are omitted. Refer to the following lists for their part numbers.
- MF:μF, PF:μF.

### RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.

- F : nonflammable

The components identified by shading and mark ▲ are critical for safety. Replace only with part number specified.

### COILS

- MMH : mH, UH : μH

### NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "▲" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (▲-▲▲▲-▲▲-XX or ▲-▲▲▲-▲▲-X) may be different from those used in the set.

### CAPACITORS:

- All capacitors are in pF. Common capacitors are omitted. Refer to the following lists for their part numbers.
- MF:μF, PF:pF.

### RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.

- F : nonflammable

The components identified by shading and mark ▲ are critical for safety. Replace only with part number specified.

### COILS

- MMH : mH, UH : μH

### NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "•" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (Δ-ΔΔΔ-ΔΔΔ-XX or Δ-ΔΔΔΔ-ΔΔΔ-X) may be different from those used in the set.

### CAPACITORS:

- All capacitors are in  $\mu\text{F}$ . Common capacitors are omitted. Refer to the following lists for their part numbers.  
MF:  $\mu\text{F}$ , PF:  $\mu\mu\text{F}$ .

### RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.
- F : nonflammable

The components identified by shading and mark  are critical for safety. Replace only with part number specified.

### COILS

- MMH : mH, UH :  $\mu\text{H}$

## ELECTRICAL PARTS

Ref.No. Part No. Description

T901	Δ.1-543-098-00	CORE				
T902	Δ.1-543-100-00	CORE				
T903	Δ.1-447-099-00	TRANSFORMER, CONVERTER				
TH701	1-800-427-00	POSISTOR				
TM901	1-536-571-00	TERMINAL BOARD, 4P (SPEAKER A)				
TM902	1-536-571-00	TERMINAL BOARD, 4P (SPEAKER B)				
D655	8-719-200-02	10E2				
D656	8-719-815-55	1S1555				
D657	8-719-815-55	1S1555				
D658	8-719-422-21	1T22AM				
D659	8-719-422-21	1T22AM				
D660	8-719-422-21	1T22AM				
D661	8-719-422-21	1T22AM				
D662	8-719-815-55	1S1555				
D663	8-719-815-55	1S1555				
D701	8-719-815-55	1S1555				
D702	8-719-815-55	1S1555				
D703	8-719-936-33	EQB01-33				
D704	8-719-910-92	HZ9A2L				
D901	Δ.8-719-815-55	1S1555				
D902	Δ.8-719-815-55	1S1555				
D903	Δ.8-719-300-22	CTU22U				
D904	Δ.8-719-300-22	CTU22U				
D905	Δ.8-719-210-12	10DF2				
D906	Δ.8-719-210-12	10DF2				
D907	Δ.8-719-210-12	10DF2				
D908	Δ.8-719-210-12	10DF2				
D951	Δ.8-719-230-24	30DL4FA				
D952	Δ.8-719-230-24	30DL4FA				
D953	Δ.8-719-230-24	30DL4FA				
D954	Δ.8-719-230-24	30DL4FA				

### NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "Δ" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (Δ-ΔΔΔ-ΔΔΔ-XX or Δ-ΔΔΔΔ-ΔΔΔ-X) may be different from those used in the set.

### CAPACITORS:

- All capacitors are in μF. Common capacitors are omitted. Refer to the following lists for their part numbers. MF:μF, PF:μμF.

### RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.

- F : nonflammable

The components identified by shading and mark Δ are critical for safety. Replace only with part number specified.

### COILS

- MMH : mH, UH : μH
